                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            a modified polylinker; Site_1: Not I; Site_2: Eco RI; Equal amounts of plasmid DNA from three normalized libraries (fetal lung NbHLIPW, testis NHT, and B-cell NCI_CGAP_GCB1) were mixed, and ss circles were made in vitro. Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from pools of 5,000 clones made from the same 3 libraries. The pools consisted of I.M.A.G.E. clones 297480-302087, 682632-687239, 726408-728711, and 729096-731399. Subtraction by Bento Soares and M. Fatima Bonaldo. "

Double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified pT7T3 vector. Library is normalized. Library was constructed by Bento Soares and M. Fatima Bonaldo. "
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /tissue_type="adenocarcinoma"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                were made in vitro. Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from pools of 5,000 clones made from the same 3 libraries. The pools consisted of I.M.A.G. E. clones 260232-265223, 340488-34479, and 484488-489479."

Double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified pT7T3 vector. Library is normalized. Library was constructed by Bento Soares and M. Fatima Bonaldo. **

Submitted (24-FEB-2000) Human Genome.Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA
On Nov 4, 2000 this sequence version replaced gi:9929587.
                                                                                                                                                                                                                                                                                                                                                                                                                                                 Center project Information
Center project name: MACA
Center clone name: MACA
Center clone name: MACA
Center clone name: MACA
Center clone name: RP23-278J12

Sequencing vector: M13; L08821
Chemistry: Dye-primer Bodipy: 95% of reads
Chemistry: Dye-terminator Big Dye: 5% of reads
Chemistry: Dye-terminator Big Dye: 5% of reads
Assembly program: Phrap; version 0.990329
Consensus quality: 178769 bases at least Q40
Consensus quality: 172780 bases at least Q40
Consensus quality: 179030 bases at least Q20
Estimated insert size: 180377; sum-of-contigs estimation
Quality coverage: 0x in Q20 bases; agarose-fp estimation
Quality coverage: 3.2x in Q20 bases; sum-of-contigs estimation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Fernandez,C., Ferraguto,D., Forcum-Tansey,J., Gill,R.,

**NOTE: This is a 'working draft' sequence. It currently
**consists of 19 contigs. The true order of the pieces
**is not known and their order in this sequence record is
** arbitrary, Gaps between the contigs are represented as
**runs of N, but the exact sizes of the gaps are unknown.
**This record will be updated with the faished sequence

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                     Score

Detecting the presence or amount of conductin, at protein or nucleic acid levels, is used to diagnose tumours, while agents that (re)activate conductin are used for tumour therapy. Conductin binds to beta-catenin and induces its cytoplasmic degradation, resulting in blockade of the Wnt/Wingless signalling pathway in vertebrates. Conductin also binds to Adenomatous Polyposis Coli (APC) fragments and, in conjunction with APC, acts as a tumour suppressor.

Detecting the presence or amount of conductin, at protein or nucleic acid levels, is used to diagnose tumours, while agents that (re)activate conductin are used for tumour therapy. Conductin binds to beta-catenin and induces its cytoplasmic degradation, resulting in blockade of the Wnt/Wingless signalling pathway in vertebrates. Conductin also binds to Adenomatous Polyposis Coli (APC)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Nucleic acids encoding mutant and wild type Axin and oligonucleotides derived from them are useful for detecting mutations in the Axin gene and for determining whether a subject is likely to develop cancer (including breast, colorecta), gastrointestinal, esophageal, carcinomas or melanomas). The wild type Axin and homologues of Axin are useful for treating subjects who are likely to develop cancer (thyroid carcinomas). The nucleic acids are also useful for diagnosing cancer and for detecting mutations in cancerous cells. Wild type Axin, its antisense molecule and identified compounds form pharmaceutical compositions in the treatment of cancer. The compositions are also useful for treating cancer by inhibiting tumorigenesis (by inducing degradation of beta-catenin). The nucleic acid encoding Axin acts through negative regulation of the treatment of the first treatment acts.
                                                                                                                                                                                                                                                                                                                                                                                                                                                           1772

                                                                                                                                                                                                                                                                                                                                                                                                          CC C74446 to C77606 encode the proteins given in B40237 to B43397, which CC represent the human ORRX open reading frames I to 3161. The ORRX CC sequences have activities such as: cytostatic; hepatotropic; vulnerary; CC antipsoriatic; antiparkinsonian; nootropic; neuroprotective; osteopathic; cardiant; thrombolytic; coagulant; vasotropic; antidiabetic; hypotensive; CC cardiant; thrombolytic; coagulant; vasotropic; antidiabetic; hypotensive; CC dermatological; immunosuppressive; antithripamatory; antibacterial; cc antiviral; antifungal; antirheumatic; antithromatory; antibacterial; cc sequences can be used for determining the presence of or predisposition CC to, or preventing or treating pathological conditions associated with an CC ORFX-associated disorder. The nucleic acids can be used to express ORFX CC proteins in gene therapy vectors. The proteins and nucleic acids may be CC used to treat cancers, proliferative disorders, neurodegenerative CC disorders, osteoarthritis, graft vs host disease, cardiovascular disease, CC diabetes mellitus, hypertension, hypothyroidism, cholesterol ester CC storage, systemic lupus erythematosus, severe combined immunodeficiency CC contense coamilation, to inhibit thrombosis, and as a contractive to contense coamilation, to inhibit thrombosis, and as a contractive to contense coamilation.

                                                                                                                                                                                                                                                                                                     Nucleic acids encoding mutant and wild type Axin and coligonucleotides derived from them are useful for detecting mutations in the Axin gene and for determining whether a subject is likely to develop cancer (including breast, colorectal, gastrointestinal, esophageal, carcinomas or melanomas). The wild type Axin and homologues of Axin are useful for treating subjects who are likely to develop cancer (thyroid carcinomas). The nucleic acids are also useful for diagnosing cancer and for detecting mutations in cancerous cells. Wild type Axin, its antisense molecule and identified compounds form pharmaceutical compositions in the treatment of cancer. The compositions are also useful for treating cancer by inhibiting tumorigenesis (by inducing degradation of beta-catenin). The nucleic acid encoding Axin acts through congestive regulation of the Wnt pathway in the Nieuwkoop Center.

Host cells expressing the polypeptides are useful for screening for ligands of an imidazoline receptor. Restriction fragments of the polypucleotide are useful as labeled probes for isolating and identifying DNA material encoding polypeptides that are receptive to imidazoline compounds. The isolation of polypucleotides encoding the imidazoline receptive polypeptides have immunological and ligand binding properties, which enable identification of agents having greater potency and/or more selectivity for these receptors.

                                                                                                                                                                                                                                                                                                                                                                                                                                                         CC expression of genes in a first filamentous fungal (FF) cell relative to cells. The method uses fluorescence-labeled nucleic acids isolated from the FF cells and a substrate of expressed sequence tags (EST). The ESTS CC are used in the methods for monitoring differential expression of genes CC in a first filamentous fungal (FF) cell relative to expression of genes CC in a first filamentous fungal (FF) cell relative to expression of genes CC in a first filamentous fungal (FF) cell relative to expression of the ESTS CC same genes in one or more second filamentous fungal cells. Monitoring CC potential of the microorganisms to be improved. New genes may be consisted function of genes from FF cells allows the production consisted and gene copy number variation and stability can be consisted and gene copy number variation and stability can be consisted and gene copy number variation and stability can be consisted and gene copy number variation and stability can be consisted and to changes in culture conditions, environmental stress, spore consisted and the companies over genomic or random cDNA CC consisted to changes in culture conditions, environmental stress, spore consisted one gene or open reading frame, and organisation of the collaboration of the gene products to facilitate consisted one gene or open reading frame, and organisation of the microarrays based on function of the gene products to facilitate consisted to F14878 represents ESTs from Aspergillus oryzae; and F14879 to E1337 represents ESTs from Aspergillus oryzae; and F14879 to E1337 represents ESTs from Aspergillus oryzae; and F14879 to consiste to consiste the first of the first

                                                                                                                                                                                                                                                                                                                                                                                                                     The specification describes the use of p53 transcription tags for developing products to determine p53 status, to diagnose cancer and to evaluate cytotoxicity or carcinogenicity of a test agent. A method for diagnosing cancer or determining p53 status in a sample suspected for being neoplastic comprises comparing the level of transcription of an RNA transcript in a first sample (s1) of a first tissue (t1) to the level of transcription of the transcript in a second sample (s2) of a second tissue (s2), where s1 is suspected of being neoplastic and s2 is a normal human tissue (of the same type) and the transcript is identified by a tag; and categorizing s1 as neoplastic or as having a mutant p53 when transcription is found to be the same or lower in the first, than in s2. The methods and products can be used to determine p53 status, to diagnose cancer and to evaluate cytotoxicity or carcinogenicity of a test agent. X86265-75 encode human PIG proteins.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence represents the human longevity assurance gene 1 (LAGI), designated LAGIHs. The LAGIHs cDNA was isolated from total brain mRNA. The LAGI protein, or proteins with at least 25-30% homology to the LAGIHs protein, is administered to increase the longevity of a human cell: Expression of these polypeptides is used to increase tolerance of human cells to cellular stresses, such as starvation or acidic pH (5-5.5). The LAGI proteins are also used for increasing reproductive capacity of human cells. LAGI polynucleotides can be used as probes for detecting LAGI from different species, as the LAGI gene is highly conserved across the spectrum of eukaryotes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 10384 BP; 2135 A; 2839 C; 3598 G; 1812 T; 0 other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                               The sequences given in Q32483-501 are various clones which were used in the isolation of the NS2-NS4 regions of the Hepatitis C Virus (HCV) gene of the invention (see also Q32442 and Q32472-82). These sequences were isolated from the serum of a patient suffering from hepatitis C (HC). The isolated RNA sequences were converted into cDNA using transcriptase in the presence of one of the primer sequences given in Q32578-79. The sequences were then amplified using primer pairs. The cDNA sequences isolated represent different alleles of the same region of the HCV gene. Sequence comparisons of these clones showed that it is possible for a patient to carry more than one HCV strain at one time. See also Q32436.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          12-JUL-1991;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  the invention. These sequences were isolated from the serum of a patient suffering from hepatitis C (HC). The isolated RNA sequences were converted into CDNA using transcriptase in the presence of one of the primer sequences given in 03253-64. The sequences were then amplified using primer pairs. The cDNA sequences isolated represent different alleles of the same region of the HCV gene. Sequence comparisons of these clones showed that it is possible for patient to carry more than one HCV strain at one time. See also

The sequences were then amplified using primer pairs. The cDNA sequences isolated represent different alleles of the same region of the HCV gene. Sequence comparisons of these clones showed that it is possible for a patient to carry more these clones showed that it is possible for a patient to carry more

These sequences were isolated from the serum of a patient suffering from sequences were isolated from the sequences were converted into cDNA using transcriptase in the presence of one of the primer cDNA using transcriptase in the presence of one of the primer sequences given in Q32578-79. The sequences were then amplified
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     07-OCT-1991;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 1280 BP;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    using primer pairs. The cDNA sequences isolated represent different alleles of the same region of the HCV gene. Sequence comparisons of these clones showed that it is possible for a patient to carry more than one HCV strain at one time. See also Q32436.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence is the gene encoding the mouse Kv6.2 monomer, which is an alpha subunit of heteromeric voltage-gated potassium channel. It is isolated from brain tissue and maintains the resting potential and controls the excitability of a cell. Kv6.2 polypeptide can be used to identify compounds, that modulate the ion flux through heteromeric voltage-gated potassium channels. Such modulators are used as neuroprotective agents and for treating CNS disorders, such as migraines, hearing and vision problems, psychotic disorders and seizures. It can also be used as reporter molecules in assays and to produce antibodies. Kv6.2 DNA sequence can be used to produce specific primers or probes

                                                                                                                                                                                                                                                                                                The sequences given in Q32483-501 are various clones which were used in the isolation of the NS2-NS4 regions of the Hepatitis C virus (HCV) gene of the invention (see also Q32442 and Q32472-82). These sequences were isolated from the serum of a patient suffering from hepatitis C (HC). The isolated RNA sequences were converted into CDNA using transcriptase in the presence of one of the primer sequences given in Q32578-79. The sequences were then amplified using primer pairs. The CDNA sequences isolated represent different alleles of the same region of the HCV gene. Sequence comparisons of these clones showed that it is possible for a patient to carry more than one HCV strain at one time. See also Q32436.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
